

## RF-35A2 Ultra Low Loss Power Amplifier Substrate

**RF-35A2** is designed with an ultra low fiberglass content to achieve “best in class” insertion loss properties and a homogeneous dielectric constant throughout the laminate.

The uniform dispersion of ceramic throughout the laminate yields extremely low x and y coefficients of thermal expansion. The low modulus and low x-y CTE values make RF-35A2 an attractive material for the surface mounting of chip carriers.

RF-35A2 is manufactured in a proprietary multi-step process that provides excellent dielectric properties along with superior copper peel adhesion.

The low 0.0011 dissipation factor at 1.9 GHz allows for maximum power transfer resulting in low heat generation.

Taconic is a world leader in RF laminates and high speed digital materials, offering a wide range of high frequency laminates and prepregs. These advanced materials are used in the fabrication of antennas, multilayer RF and high speed digital boards, interconnections and devices.

**Cross-section of RF-35A2 construction**

### Benefits & Applications:

- Low loss properties
- Dk tolerance of +/-0.05
- Homogeneous Dk
- Excellent peel strength
- Low moisture absorption
- Ease of drilling

- 
- Power amplifiers
  - Filters/couplers
  - High speed digital
  - Multilayer
  - Passive components
  - Wireless antennas

# RF-35A2 Ultra Low Loss Power Amplifier Substrate

## PTFE Composites vs. Rubber (Hydrocarbon) Composites:

A primary difference between PTFE-based composites and rubber based (hydrocarbon) substrates is PTFE is oxidation resistant. PTFE starts to degrade near 600° C when the carbon-fluorine bond starts to fail. PTFE is a thermoplastic and does not have unreactive chemistry after processing. Rubbers, however, cure by a thermosetting mechanism and never cure to completion, thus leaving some level of unreacted chemistry. Rubber substrates are not temperature stable or oxidation resistant which causes these materials to turn yellow and then black with air/heat. Automotive rubber is typically sulfur cured and contains a high level of carbon black. These additives cannot be used in laminates due to their poor electrical properties.

Laminate suppliers cannot use the same strategies as the automotive industry to stabilize their rubber. This leaves the rubber (hydrocarbon) products susceptible to temperature driven oxidation (a time and temperature-based phenomenon). Oxidation, diffusion, stress relaxation and any process that is temperature related generally follows an Arrhenius relationship where the rate of oxidation doubles with every ten degree rise. Rubber oxidation is no exception; with exposure to temperature and air, rubbers oxidize, embrittle and their elongation and peel strength decrease while their dielectric constant and dissipation factor increase.

Figure 1

Dk Changes According to Aging Time (1,000 hrs.)

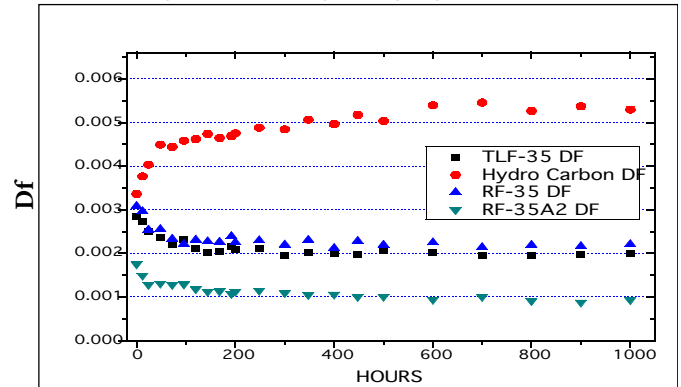

Figure 2

Df Changes According to Aging Time (1,000 hrs.)

PTFE-fiberglass products such as RF-35A2 do not suffer from a change in their dielectric constant or dissipation factor with temperature exposure. Figures 1 and 2 show the change in dielectric constant and dissipation factor of a non-brominated rubber (Hydrocarbon) and PTFE ceramic fiberglass laminates (TLF-35, RF-35 and RF-35A2) with exposure to air at 195°C. Figure 3 shows similar trends for peel strength. Copper peel strength will decline with temperature due to the oxidation of the copper in addition to any factors that would cause embrittlement of the resin system. This oxidation (yellowing) will occur at as low as 95° C over prolonged time periods.

Dissipation Factor vs Frequency

All reported values are typical and should not be used for specification purposes. In all instances, the user shall determine suitability in any given application. Test data obtained using a 0.0600" sample and 10 mil building blocks.

# RF-35A2 Ultra Low Loss Power Amplifier Substrate

Designation	Dielectric Constant
RF-35A2	3.50 +/-0.05

Typical Thicknesses <sup>1</sup>	
Inches	mm
0.0050	0.13
0.0100	0.25
0.0200	0.51
0.0300	0.76
0.0600	1.52

Available Sheet Sizes <sup>2</sup>	
Inches	mm
12 x 18	304 x 457
16 x 18	406 x 457
18 x 24	457 x 610
16 x 36	406 x 914
24 x 36	610 x 914

<sup>1</sup>RF-35A2 can be manufactured in increments of 0.0100". Please call for availability of additional thicknesses.

<sup>2</sup>Our standard sheet size is 36" x 48" (914 mm x 1220 mm). Please contact our customer service department for availability of other sizes.

Available Copper Cladding						
Designation	Weight	Copper Thickness		R <sub>MS</sub> Treated Side		Description
C1 (C1)	1 oz/ft <sup>2</sup>	~0.0014"	~35 μm	25 μin	0.6 μm	Very low profile / Electrodeposited
CVH (CH)	1/2 oz/ft <sup>2</sup>	~0.0007"	~18 μm	27 μin	0.7 μm	Very low profile / Electrodeposited
C2	2 oz/ft <sup>2</sup>	~0.0028"	~70 μm	77 μin	2.0 μm	Electrodeposited
CLH	1/2 oz/ft <sup>2</sup>	~0.0007"	~18 μm	13 μin	0.3 μm	Reverse treated/Electrodeposited
CL1	1 oz/ft <sup>2</sup>	~0.0014"	~35 μm	13 μin	0.3 μm	Reverse treated/Electrodeposited

Heavy metal claddings (aluminum, brass & copper) may also be available upon request. Please call for information.

Insertion losses were measured using a ring resonator (1.88 mm trace width, 0.487 dielectric thickness, gap 0.15 mm, circumference 178.5 mm, internal radius 54.967 mm, external radius 58.727)

An example of a 30 mil material with 1 oz. copper on both sides is part #:
